

Pattern Lab (ML) — run a prediction batch, review, approve, watch it reach the student page

WHAT IT IS

The quiet corner where machine-learning predictions live. A model produces predictions (say, submission-timeliness scores); an analyst reviews them; an approver signs them off; only then do the predictions become visible to end users. Permissions gate every step. Nothing an ML pipeline emits reaches a supervisor's screen without a human on the approval chain. In this chapter we open a recent batch, review it, approve one prediction, and then jump to that student's page to see the approved prediction appear.

THE CLICKS

01 Open Pattern Lab

WHERE Sidebar → **Pattern Lab** (under **ADVANCED**).

DO Show the runs list.

SEE Rows: model name, run date, prediction count, review status.

SAY *“Every ML run is a row here. Nothing gets promoted to production without going through review and sign-off.”*

02 Open a recent batch

WHERE Latest “submission timeliness” batch → click.

DO Show the predictions table.

SEE Columns: student, prediction (e.g. Likely to miss submission window), confidence (0.72), reviewer, approver, status.

SAY *“Every row is a prediction on one student. Confidence beside the label — nothing hidden.”*

03 Review one prediction

WHERE One row → **Review** button.

DO Read the input features shown, then click **Accept** or **Reject** with a note.

SEE Row's review status flips to “Reviewed” with my name and comment.

SAY *“Analyst pass. Confidence and features are visible — no black box.”*

04 Approve to promote

WHERE Same row → **Approve for release** (approver role, or same session with the right permission).

DO Click. Confirm.

SEE Row status flips green “Approved”. A visible-to-users flag appears on the record.

SAY *“Approver signs off. Nothing reached an end user before this click.”*

THE LINE

“Nothing an ML pipeline emits reaches an end user without a human on the approval chain.”
